Re: Dr. Natasha Salansky (Filonenko) - Letter of Recommendation

Dear Sir or Madam:

The Employee Rehabilitation unit (ERU) of t The Scarborough Hospital has been using Low Energy Photonic and Laser Therapy (LEPT) developed by IMI Inc. (Toronto, Canada) for the past two years. This modality has been successfully used as an adjunct to the physiotherapy treatment of a variety of musculoskeletal conditions.

Dr. Natasha Salansky (Filonenko) has provided informal consultations regarding the clinical application of (LEPT) to the (ERU) physiotherapists. She has demonstrated an in-depth knowledge of the clinical application of this modality with acute, sub-acute and chronic musculoskeletal conditions seen in the ERU.

LEPT has assisted many employees experience decreased pain and soft tissue swelling and subsequent increased functional ability at work. LEPT has helped with the resolution of both chronic and acute conditions in addition to exercise and other physiotherapy treatments. No adverse effects have been observed during the past two year.

The ERU staff recommends the use of LEPT as an adjunct to physiotherapy treatment for injured employees. Additionally, the consultations provided by Dr. Filonenko have been invaluable in the clinical application of LEPT to maximize the benefits for The Scarborough Hospital employees.
